Introduction

```
library(patchwork)
source("Survival/utils.R")

# Setup analysis environment
analysis_setup <- setup_analysis()
paths <- analysis_setup$paths
demo <- analysis_setup$demo

demo$FC <- log(demo$FC)
```

worthwhile to first consider how questionnaires were completed for each month.

As should be expected, there is a small degree of attrition of responses over time (Figure 1). However, there is a large increase at the end of followup (M24) as additional communications were sent which encouraged the completion of the final questionnaire.

```

monthly <- read_xlsx(paste0(paths$data.path, "Followup/monthlyQ.xlsx"))

# Create plots using utility function
p1 <- create_monthly_response_plot(
  monthly,
  fill_color = "#F17300",
  border_color = "#904200",
  y_label = "Monthly questionnaire responses"
)

monthly.fc <- monthly %>%
  filter(ParticipantNo %in% subset(demo, !is.na(cat))$ParticipantNo)

p2 <- create_monthly_response_plot(
  monthly.fc,
  fill_color = "#A8201A",
  border_color = "#6F0802",
  y_label = "Monthly questionnaire responses"
)

monthly.ffq <- monthly %>%
  filter(ParticipantNo %in% subset(demo, (!is.na(cat)) & (!is.na(fibre)))$ParticipantNo)

p3 <- create_monthly_response_plot(
  monthly.ffq,
  fill_color = "#0F8B8D",
  border_color = "#005354",
  y_label = "Monthly questionnaire responses",
  x_label = "Month of follow-up"
)

p

```

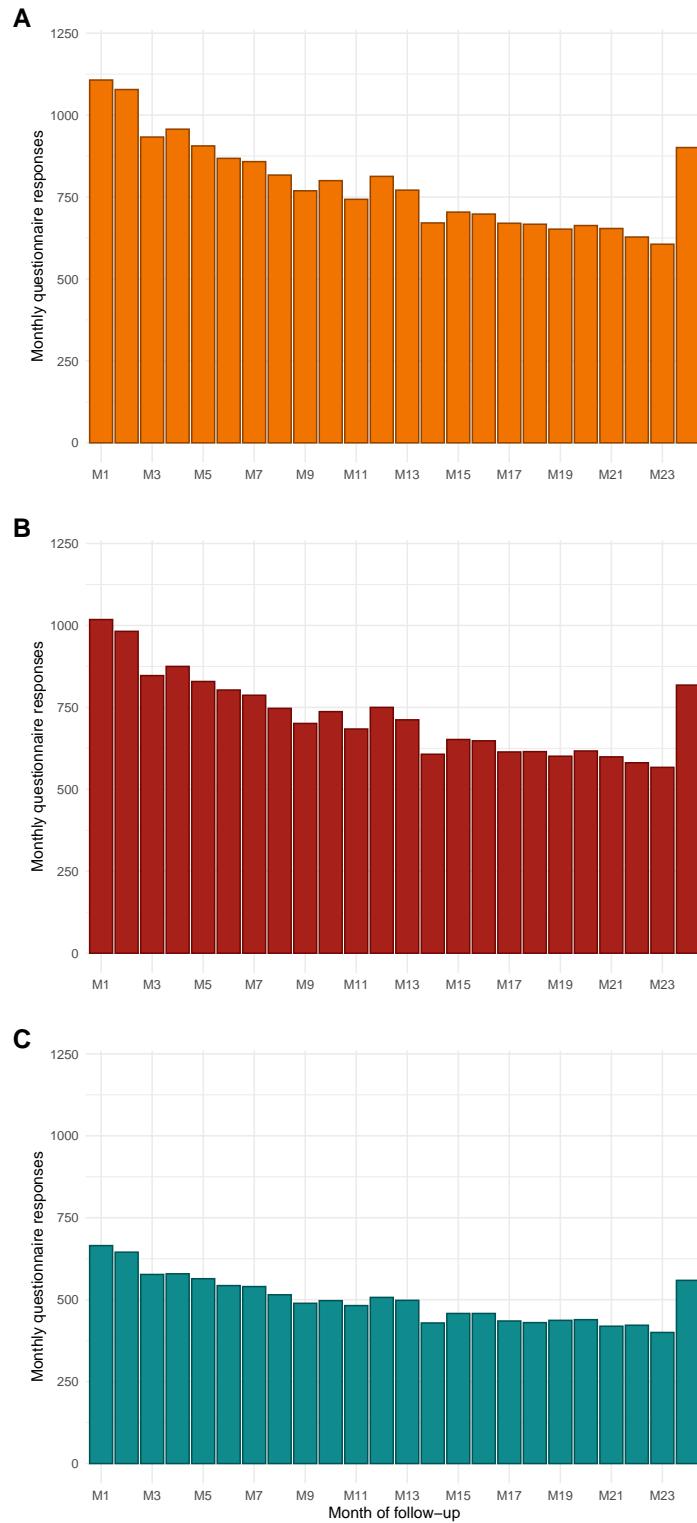

Figure 1: Number of responses for each month of follow-up for (A) the whole cohort, (B) the FC cohort, and (C) the FFQ cohort.

Primary outcome: First patient-reported flare

```
flares <- read_xlsx(  
  paste0(paths$all.flare.path, "all-flares.xlsx"),  
  na = ".",  
  sheet = 1  
) %>%  
  select(ParticipantNo, softflare, softflare_time, hardflare, hardflare_time)  
  
flare.df <- merge(demo, flares, by = "ParticipantNo")
```

For patient-reported flares, a flare is primarily defined by a subject reporting their disease as uncontrolled. The time of the flare is given by the date the subject reported their symptoms worsening.

If a date for when the symptoms worsened is given, but the subject did not answer if their disease was uncontrolled, it is assumed their disease is not controlled (in other words, it is assumed a patient-reported flare occurred).

If a subject reported their disease as being uncontrolled, but did not give a date for the worsening of their symptoms, then the earliest date given for either an IBD outpatient appointment, emergency hospital admission, call with their IBD care team, or surgery in the questionnaire response was used. If none of these dates were provided then the date of the questionnaire response was used instead.

If a hard flare occurs prior to a patient-reported flare then the patient-reported flare is assumed to occur on the same date as the hard flare.

A complete description of the steps taken to calculate patient-reported flares is outlined in the below drop-down section.

Steps for calculating patient-reported flares

1. If date of flare is before date of entry to study, then delete flare date and recode diseasecontrolled as 1.
2. If flare date is after the questionnaire date (I.E in the future), reset flare date to questionnaire date.
3. If questionnaire completed after date of withdrawal, remove.
4. If date of flare is >2 years after entry, censor patient-reported flare at 2 years.
5. Time is earliest of flare time or end of follow up, from entry date.
6. All data censored at 2 years.
7. Including the hard flares (hard flare data are much more straightforward, flare=diseaseflareyn and flare date=firstflarestartdate from EOS data)

- If both datasets say no flare, patient-reported flare is no and follow up time from hard flare \leq 2 years, patient-reported flare time is longest of questionnaire and hard flare times
- If both datasets say no flare, patient-reported flare is no and follow up time from hard flare $>$ 2 years, patient-reported time is 2 years
- If no flare in questionnaires, but hard flare reported before 2 years of follow up, take hard flare data
- If no flare in questionnaires, but hard flare reported after 2 years, patient-reported flare is no and patient-reported flare time is 2 years
- If flare in questionnaire and no hard flare, patient-reported flare from questionnaire data
- If flare in questionnaire and also hard flare, take the earliest time
- If questionnaire data is missing and no hard flare, patient-reported flare is no and time is earliest of hard flare follow up and 2 years
- If questionnaire data is missing and hard flare reported within 2 years, patient-reported flare data are taken from hard flare data
- If questionnaire data is missing and hard flare reported after 2 years then patient-reported flare is no and time is 2 years
- Otherwise if questionnaire data is not missing and hardflare is, then patient-reported flare is taken from questionnaire data

All times are taken from the earliest reported flare.
